

Assignment -2

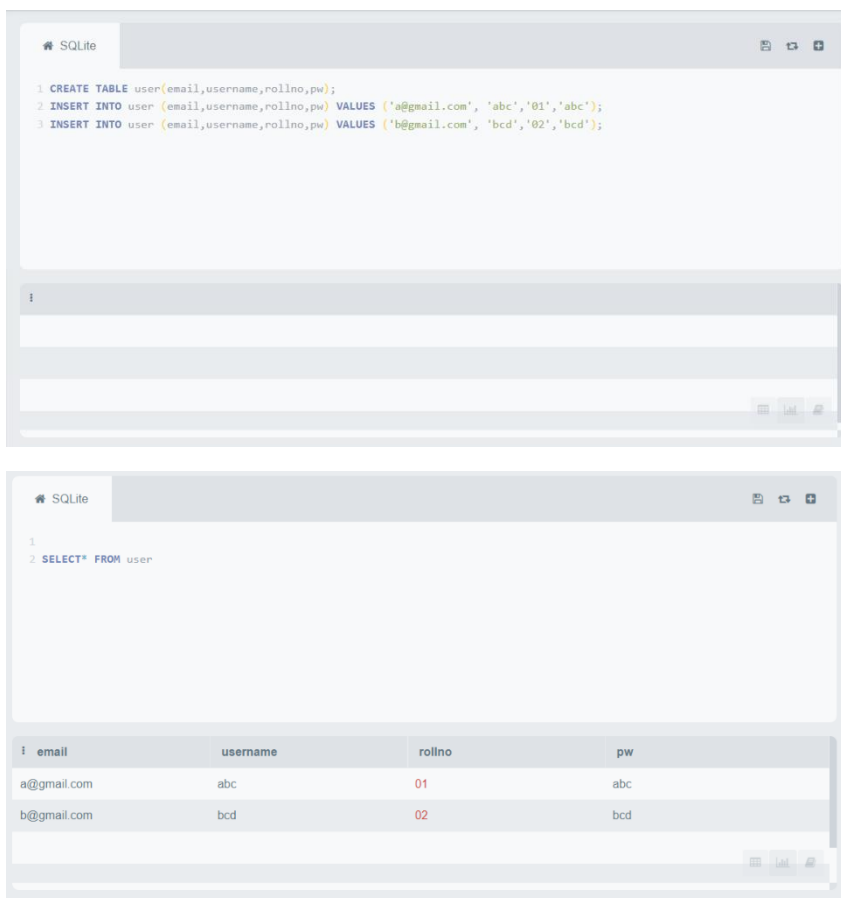

Question-1:

Create User table with user with email,username,roll number, password.

Solution:

```
CREATE TABLE user(email,username,rollno,pw);
INSERT INTO user (email,username,rollno,pw) VALUES ('a@gmail.com', 'abc','01','abc');
INSERT INTO user (email,username,rollno,pw) VALUES ('b@gmail.com', 'bcd','02','bcd');
INSERT INTO user (email,username,rollno,pw) VALUES ('c@gmail.com', 'cde','03','cde');
INSERT INTO user (email,username,rollno,pw) VALUES ('d@gmail.com', 'def','04','def');
```

Output:

The image shows two screenshots of the SQLite IDE. The top screenshot displays the SQL queries entered: a CREATE TABLE statement for 'user' and two INSERT statements. The bottom screenshot shows the result of a SELECT query, displaying a table with four columns: email, username, rollno, and pw. The data rows show 'a@gmail.com' with username 'abc' and rollno '01', and 'b@gmail.com' with username 'bcd' and rollno '02'.

```
1 CREATE TABLE user(email,username,rollno,pw);
2 INSERT INTO user (email,username,rollno,pw) VALUES ('a@gmail.com', 'abc','01','abc');
3 INSERT INTO user (email,username,rollno,pw) VALUES ('b@gmail.com', 'bcd','02','bcd');
```

```
1
2 SELECT* FROM user
```

email	username	rollno	pw
a@gmail.com	abc	01	abc
b@gmail.com	bcd	02	bcd

Question-2:

Perform UPDATE,DELETE Queries with user table

Solution:

```
UPDATE user SET username = 'alpha' WHERE rollno = '01';
SELECT* FROM user
```

```
DELETE FROM user WHERE username = 'bcd';
SELECT* FROM user
```

Output:

The screenshot shows the SQLite GUI with the following SQL commands:

```
1 UPDATE user SET username = 'alpha' WHERE rollno = '01';
2
3 SELECT* FROM user
```

The resulting table has the following data:

email	username	rollno	pw
a@gmail.com	alpha	01	abc
b@gmail.com	bcd	02	bcd

The screenshot shows the SQLite GUI with the following SQL commands:

```
1 DELETE FROM user WHERE username = 'bcd';
2
3 SELECT* FROM user
```

The resulting table has the following data:

email	username	rollno	pw
a@gmail.com	alpha	01	abc

Question-3:

Connect python code to db2.

Solution:

```
pip install ibm_db
from ibm_db import connect
connection = connect('DATABASE=<database name>;'
                    'HOSTNAME=<database ip>;' # 127.0.0.1 or localhost works if it's local
                    'PORT=<database port>;'
                    'PROTOCOL=TCPIP;'
                    'UID=<database username>;'
                    'PWD=<username password>;', ", ")
def results(command):
```

```
    from ibm_db import fetch_assoc
```

```
    ret = []
    result = fetch_assoc(command)
    while result:
        ret.append(result)
        result = fetch_assoc(command)
    return ret # Ditch this line if you choose to use a generator.
from ibm_db import tables
```

```
t = results(tables(connection))
```

```
from ibm_db import exec_immediate

sql = 'LIST * FROM ' + t[170]['TABLE_NAME']
rows = results(exec_immediate(connection, sql))
```

Question-4:

Create a flask app with registration page, login page and welcome page. By default load the registration page once the user enters all the fields store the data in database and navigate to login page authenticate user username and password. If the user is valid show the welcome page

Solution:

```
@app.route('/login', methods=['GET', 'POST'])
def login():
    error = None
    if request.method == 'POST':
        if request.form['username'] != 'admin' or request.form['password'] != 'admin':
            error = 'Invalid Credentials. Please try again.'
        else:
            return redirect(url_for('home'))
    return render_template('login.html', error=error)
```

html code:

```
<html>
<head>
<title>Flask Intro - login page</title>
<meta name="viewport" content="width=device-width, initial-scale=1.0">
<link href="static/bootstrap.min.css" rel="stylesheet" media="screen">
</head>
<body>
<div class="container">
<h1>Please login</h1>
<br>
<form action="" method="post">
<input type="text" placeholder="Username" name="username" value="{{
request.form.username }}">
<input type="password" placeholder="Password" name="password" value="{{
request.form.password }}">
<input class="btn btn-default" type="submit" value="Login">
</form>
{% if error %}
<p class="error"><strong>Error:</strong> {{ error }}
{% endif %}
</div>
</body>
</html>
```

Output:

Please login

Login

Error: Invalid credentials. Please try again.

Hello, World!
